

French Learning Website Plan

A practical roadmap for replacing a long Google Doc with a searchable, reviewable personal learning app.

Recommended stack

React + Vite + Tailwind CSS + lucide-react + localStorage. Start simple, validate the learning workflow, then move to Supabase when cloud sync and accounts matter.

Why This Stack

- **React + Vite:** fast setup, simple structure, and great for interactive study tools.
- **Tailwind CSS:** quick to style consistently without maintaining a large CSS system.
- **lucide-react:** clean icons for search, edit, review, audio, tags, and navigation.
- **localStorage first:** no backend needed while testing the structure and daily workflow.
- **Supabase later:** add Postgres, auth, sync, backups, and optional audio/file storage when the app is worth growing.

Core Product Shape

The website should organize everything into structured learning objects instead of one long stream of notes. Each item can be searched, tagged, edited, and reviewed.

Section	Purpose
Today	Daily review queue, weak items, and one focused learning session.
Vocabulary	Words with meaning, gender, part of speech, example sentence, pronunciation note, tags, and confidence.
Phrases	Short practical expressions grouped by situation or context.
Grammar	One concept per card with explanation, examples, and common mistakes.
Pronunciation	Tricky sounds, pronunciation guides, example words, and optional audio notes.
Review	Flashcard mode with 'I know this' and 'Needs practice' outcomes.
Search	Find any word, phrase, grammar note, or pronunciation entry instantly.

Phased Build Plan

Phase 1: Personal Learning Dashboard

Build the app shell: sidebar navigation, top search, main content area, add/edit panel, tags, filters, and sample data.

Phase 2: Structured Entry System

Create entry forms for vocabulary, phrases, grammar, and pronunciation. Save entries locally first.

Phase 3: Review Mode

Turn saved notes into flashcards. Add confidence states like 'I know this' and 'Needs practice'.

Phase 4: Import Existing Notes

Move content from the current Google Doc or PDF into structured entries. Start manual, then consider CSV or AI-assisted extraction.

Phase 5: Cloud Sync

Move persistence from localStorage to Supabase when you want accounts, sync across devices, backups, and audio/file storage.

First milestone

A working French learning dashboard where you can add, search, tag, edit, and review vocabulary, phrases, grammar notes, and pronunciation notes.

Initial Data Model

- **Vocabulary:** French word, English meaning, gender, part of speech, example sentence, pronunciation note, tags, difficulty, confidence.
- **Phrase:** French phrase, English meaning, context, notes, tags.
- **Grammar:** concept title, explanation, examples, common mistakes, tags.
- **Pronunciation:** sound or word, pronunciation guide, example words, notes.

Design Direction

Use a calm dashboard style: off-white background, deep navy or charcoal text, restrained blue and red accents, compact cards, clear filters, and no marketing-style landing page. The first screen should be the usable learning workspace.

Suggested opening screen: 'Bonjour, John. Ready for 12 minutes of French?' followed by today's lesson, due review items, weak words, and weekly progress.

Decision

Start with React + Vite + Tailwind + lucide-react + localStorage. Build the learning workflow first. Add Supabase only after the structure proves useful.
